

INVERTER TECHNOLOGY

A technical advantage for more quality. So far, different microwave powers have been generated at intervals (timeout of full power).

Now the inverter technology regulates the microwave output constantly, which means linearly. As a result, the food is heated more evenly and also reduces the energy consumption of the microwave.

In short: maximum efficiency!

INVERTER

Inverter

Inverter = „Real power control“

The inverter technology controls the power of the microwave constant, which means linear. So far, the power of microwaves is predominantly controlled over time intervals: a low power level is achieved by interrupting the uncontrollable maximum power. Gentler & more accurate.

The inverter technology makes it possible to thaw the food more gently and to heat it evenly. This preserves the taste of the food.

Gentler & more accurate
